PROFESSIONAL SUMMARY

Cloud & AI Systems Engineer who ships production AI, cloud, and API systems end-to-end - a 24/7 Telegram agent (ForChi) that automates social posting, video production, and job applications; a completed non-custodial multi-chain crypto wallet (CloudVoid) with real on-chain send and swap; and a blind-validated sports prediction engine. Built live on a \$0 stack (Contabo VPS, Hugging Face, Gemini free tier). Seeking a remote junior cloud / AI integration role where I can ship real work and learn from stronger engineers.

KEY SKILLS

AWS, Azure, Oracle Cloud (OCI), Google Cloud (Vertex AI), Linux (Ubuntu), Nginx, Docker, Kubernetes, Terraform, GitHub Actions CI/CD, PM2, systemd, Cloudflare Pages + WAF, Contabo VPS, Hugging Face Spaces (ZeroGPU) | zero-trust network design, Cloudflare WAF, DDoS mitigation, DNS routing, custom iptables rules, encrypted service-to-service communication (P-256 ECDH + HKDF-SHA256 + AES-256-GCM), non-custodial / self-custody key handling, threshold (3-of-5) arbitration, self-healing / auto-recovery infrastructure | LangChain, multi-agent orchestration, trigger-based automation design, structured function-calling, multi-tier LLM failover routing (Gemini rotation + self-hosted Qwen), RAG and vector agent memory, prompt engineering, AI voice cloning (Higgs Audio v3, F5-TTS), AI image generation (FLUX, Gemini-image, Stable Diffusion), auto-transcription (Whisper / Moonshine) | API integration & automation, RESTful API design, webhooks, OAuth 2.0 flows, YouTube Data API v3 (upload, captions, thumbnails, playlists), Facebook Graph API, LinkedIn API, Telegram Bot API, Gemini / OpenAI-style LLM APIs, ParaSwap DEX API, CoinGecko & Binance price APIs,Alchemy / chain RPCs (EVM, Solana, Tron, Aptos, Stellar), ATS application APIs (Lever, Ashby, Greenhouse, Workable) | n8n workflow automation, trigger-based pipelines, scheduled cron workflows, resume-safe self-healing build pipelines, data pipelines, daily autonomous agents | Python (FastAPI, Asyncio), Node.js, PostgreSQL, Neon, SQLite, association-rule mining, blind / out-of-sample validation | Aptos MoveVM, Move smart contracts, non-custodial escrow design, multi-chain wallets (EVM, UTXO, Solana, Tron, Aptos, Stellar)

TECHNICAL PROJECTS & EXPERIENCE

ForChi

- Built and shipped a trigger-only Node.js/LangChain agent that runs deterministic automation workflows (social posting, video pipeline, job applications) from text or voice commands, using a two-step gate-and-extraction pipeline so casual chat never accidentally fires a workflow
- Built an autonomous JOB-APPLICATION workflow: discovers remote intern/junior roles from LinkedIn + company ATS boards (Greenhouse, Lever, Ashby, Workable) + 4 aggregators, scores each against a real profile with Gemini, writes a tailored resume and human-voice cover letter per job description, then auto-applies via the ATS APIs - with a daily Telegram digest
- Built a full long-form YouTube automation pipeline (channel @sirxlud): AI script generation with a 4-act retention structure and curiosity-gap 'Why' titles, voice-cloned narration (Higgs Audio v3 TTS), AI scene + image generation, frame assembly, burned-in subtitles, thumbnails and auto-sorting into topic playlists - posting up to 2 videos a day end-to-end
- Built an earlier YouTube Shorts pipeline (AI poem cloned voice stock clips assembly upload playlist) posting ~5 Shorts/day with topic rotation across 3 pillars: romance, philosophy, and faith
- Designed a multi-tier LLM failover (Gemini key rotation with a self-hosted Qwen model as backup) to stay responsive under free-tier rate limits; integrated self-hosted Whisper transcription and FLUX/Gemini image generation
- Set up OAuth-based YouTube auth with an automatic weekly re-auth watcher, plus human-friendly self-healing error reports delivered by the bot itself

CloudVoid

- Built and COMPLETED a non-custodial multi-chain crypto wallet (15 chains: EVM, Bitcoin-family UTXO, Solana, Tron, Aptos, Stellar) - Expo/React Native UI (web + Android APK) with a Node.js/Express backend on Oracle Cloud; private keys derived client-side so the server only ever sees public addresses
- Implemented an encrypted 'Riverbed' frontend-backend envelope (P-256 ECDH + HKDF-SHA256 + AES-256-GCM) so every request is end-to-end encrypted, and secured the backend with Cloudflare WAF and custom iptables rules

- Integrated real chain APIs (Alchemy, mempool.space, Blockchair, TronGrid, Aptos fullnode, Horizon) for live balances, and real on-chain Send (locally signed) + DEX Swap via the ParaSwap API with automatic token approval - no platform fee
- Wired live price feeds from Binance + CoinGecko, real scannable QR codes, multi-wallet support with per-wallet encrypted seeds, and deployed via Cloudflare Pages + a GitHub Actions APK release pipeline
- Shipped a genuine on-chain layer end-to-end: real EVM send (local signing, nonce + gas + broadcast), real ParaSwap aggregator swaps routed through Uniswap/Curve, live balances and prices - verified against live chain RPCs (the project is complete and live)
- Earlier work on the platform: a P2P crypto-to-fiat escrow layer on Aptos MoveVM with pre-commit locking, trust-bond penalties, gas abstraction via Paymaster, and a cryptographic 3-of-5 threshold arbitration system

Project CLAY

- Designed and built a 21-container multi-agent architecture with working image generation, conversational handling, and automated social posting
- Evaluated honestly and retired the architecture in favor of a leaner, trigger-based design that directly informed ForChi

Flamchi / Footchrsto

- Built a sports prediction engine for football, basketball, and tennis using data-driven association-rule mining, discarding six earlier approaches that failed on unseen data before one held up
- Every rule validated on a blind, never-touched data window: ~69-70% football, 67% NBA, 70% tennis; the capital-safe +1 handicap market hits ~86-90%; refuses to predict when no validated pattern matches
- Latest 'Odonata dragonfly' ruleset: ~6,900 football / ~1,900 basketball / ~1,500 tennis blind-validated rules, extended to EuroLeague (through 2026), WNBA, and a table-tennis audit (~75% blind)
- Ships daily and weekly digests per sport (time - teams - projected winner) and explains WHY a pick was made via a Qwen-powered chat bot; runs live on a self-managed VPS with systemd auto-restart

Infrastructure

- Migrated all production services from Render to a self-managed Contabo VPS: systemd units with auto-restart, scheduled timers, and a Telegram-driven health watchdog (self-healing infra)
- Self-hosted a local Qwen3 4B LLM (llama.cpp) on the VPS as the always-on chat fallback, cutting cold-start latency from minutes to seconds
- Hardened production: encrypted service-to-service traffic, iptables/Cloudflare-WAF access control, and secure key handling (refresh tokens stored durably, never in plaintext env dumps)
- Distributed 148MB of media assets via a private Hugging Face dataset with a pull-on-deploy bundle so any host boots the full pipeline in one step
- Built API-integration plumbing across YouTube, Facebook, LinkedIn, Telegram, Gemini, HF Spaces, and cloud providers - all OAuth/key-rotated with automated health checks

CERTIFICATIONS

- Cloud Computing Certification, Digital Witch (2026)
- Certified Customer Service Professional, CURSA (2025)
- IT Support Specialist, Digital Witch (2024)
