

AGU VICTOR CHIEDOZIE

Cloud & AI Systems Engineer

WAT (GMT+1) | aguchiedoxie@gmail.com | +234 816 280 2162 | linkedin.com/in/aguchiedoxie | github.com/Moorejae

PROFESSIONAL SUMMARY

I build cloud infrastructure and AI systems, alone or with a team. I build fast, usually in days rather than months. Security is part of the design from day one, not added later.

KEY SKILLS

- Cloud & Infrastructure: AWS, Azure, Oracle Cloud (OCI), Google Cloud, Linux (Ubuntu), Nginx, Docker, Kubernetes, Terraform, GitHub Actions CI/CD, PM2
- AI Agent Engineering: LangChain, multi-agent orchestration, trigger-based automation, structured function-calling, multi-tier LLM failover routing, RAG & vector memory
- Security & Reliability: zero-trust network design, encrypted communication, isolated key storage, Cloudflare WAF, self-healing infrastructure
- Data & Backend: Python (FastAPI, Asyncio), Node.js, PostgreSQL, RESTful APIs, n8n automation, Aptos MoveVM, Move smart contracts
- Agentic Coding Tools: VS Code, Claude Code, Google Antigravity, Cursor, GitHub Copilot

TECHNICAL PROJECTS & EXPERIENCE

ForChi, Designer & Builder (AI Workflow Agent)

2026 – Present (Live)

- Built and shipped a trigger-only Node.js/LangChain agent that posts automatically to Facebook and LinkedIn multiple times a day, using a two-step gate-and-extraction pipeline so casual chat never accidentally fires a workflow
- Designed a multi-tier LLM fallback (Gemini key rotation with a self-hosted model as backup) to keep the agent responsive under free-tier rate limits
- Diagnosed a platform-level network block silently killing the bot's connection, traced it to the hosting provider rather than the code, and migrated hosting to fix it. It was an infrastructure fix, not a rewrite
- Added voice-note handling and a multi-stage AI image generation pipeline, styled differently per platform

CloudVoid, Founder & Lead Systems Architect

2025 – Present

- Designed and built a non-custodial P2P crypto-to-fiat escrow platform: React frontend, Python/Node.js backend, on a zero-trust Kubernetes cluster on Oracle Cloud
- Implemented an Aptos MoveVM escrow layer with pre-commit locking, trust-bond penalty logic, and gas abstraction via Paymaster sponsorship
- Built a cryptographic 3-of-5 threshold arbitration system for on-chain dispute resolution, backend locked behind Cloudflare WAF and custom iptables rules
- Set up self-healing infrastructure: a webhook-triggered watchdog tied to PM2 for automatic recovery and zero-downtime deploys

Project CLAY, Solo Architect & Builder

2026, ~1 week

- Designed and built a 21-container multi-agent architecture with working image generation, conversational handling, and automated posting
- Hit a real limitation in video-generation handling, evaluated it honestly, and retired the architecture in favor of a leaner, trigger-based design that directly informed ForChi

Footchrsto, Systems Developer (Sports Prediction Engine)

2024 – 2026

- Built a sports prediction engine for football, basketball, and tennis using association-rule mining, discarding six earlier approaches that looked promising in testing but failed on unseen data before arriving at one that held up
- Every rule is validated on a blind, never-touched data window before going live: 69.6% accuracy on football (vs. 43% baseline), 66.8% on NBA, 69.8% on tennis. The engine refuses to predict when no validated pattern matches, rather than guessing
- Deployed as a live 24/7 Telegram bot on Render, Hugging Face, and a self-hosted LLM

CERTIFICATIONS

- Cloud Computing Certification, Digital Witch (2026)
- Certified Customer Service Professional, CURSA (2025)
- IT Support Specialist, Digital Witch (2024)
